EDUCATION

Kennesaw State University, Kennesaw, GA B.S. in Computer Science, AI Concentration | Expected May 2026 | GPA: 3.64

Honors: President's List, Dean's List

Coursework: Data Structures & Algorithms, Distributed Systems, Machine Learning, Database Systems, Operating Systems, Computer Networks, Software Engineering

SKILLS

Languages: Python, TypeScript, SQL, C#, C++ (basic), MATLAB

Frameworks/Tools: Next.js, FastAPI, Prisma, SQLAlchemy, Git, Docker

Databases/Platforms: PostgreSQL, SQLite, Dataverse, SharePoint, Linux, Microsoft Graph API, Vector DB

Core Areas: Full-stack product development, backend APIs, data modeling, distributed systems fundamentals, concurrency, event-driven workflows, debugging, creator/community analytics

AI Developer Tools: ChatGPT, Codex, Cursor, Claude

EXPERIENCE

Evidence Based Solutions | Software Developer Intern

June 2024 - Present

Remote / Cape Town

- Built enterprise applications and automation workflows using Power Apps, Power Automate, Dataverse, SharePoint, and Power BI.
- Designed multi-layer pipelines for form submission tracking, facility quotas, and country-level aggregation across 1,000+ records.
- Implemented event-driven workflows to detect completion thresholds, trigger notifications, and maintain reliable system state.
- Debugged issues involving APIs, pagination, concurrency, and data integration to improve reliability and reduce manual tracking.

Kennesaw State University | Student Assistant

Aug 2023 - Aug 2025

Kennesaw, GA

- Supported student-facing technical and administrative workflows while communicating clearly with faculty, students, and department staff.

PROJECTS

AI Job Aggregation & Tracking Platform

Next.js, TypeScript, Python, PostgreSQL, Prisma

- Built a full-stack job platform with a resolve-detect-crawl-parse-dedupe-classify pipeline across Greenhouse, Lever, and company career sites.
- Designed worker-based processing, raw-to-canonical job models, content-hash deduplication, and enrichment for role type, experience level, tech stack, and sponsorship.
- Built user-facing search, filters, workflow states, alerts, and tracker features to improve discovery and actionability.

AI Job Application Email Tracker

Python, FastAPI, Microsoft Graph API, MSAL, SQLAlchemy, SQLite, Next.js

- Built a system that ingests Outlook emails, classifies job application stages, and stores results in a tracking dashboard.
- Integrated OAuth and Microsoft Graph API while handling noisy real-world email data and duplicate job listings.
- Added logging and debugging workflows to inspect, refine, and improve classification behavior.

Distributed Polling / Coordination Project

Distributed Systems, Synchronization, Shared State

- Built a distributed system using polling-based coordination and analyzed tradeoffs between responsiveness and correctness.
- Debugged multi-component interactions involving synchronization, shared state consistency, and failure-prone workflows.

Multi-Threaded Banking System

C#

- Simulated concurrent account access with thread-safe operations and synchronization.
- Addressed race conditions and shared resource contention while practicing object-oriented design and systems debugging.
